                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                84
                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher elacaryces for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABL01840-ABL16175) and the encoded proteins (ABBC)373-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                      detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GluTyrGluAsnAlaLeuIleAspTyrProLysLysValAspGlyLeuThrAspGluGlu

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

stringency contraction to the 218-5K mucletc actd. Also included are an isolated polypeptide involved in the formation of secretory granules in cells comprising the amino acid sequence spanning amino acids 243-310 of the Zis-SR protein, restoring the neurosandocrine differentiation of a cell using the mucleic acid molecule or polypeptide cited above, identifying a gene and/or protein involved in inducing regulated secretion comprising a comparison at the molecular level of a secretion-defective cell in the absence of the conditions of the secretion-defective cell line in the absence of the conditions cited. Also included are modulating the secretion is restored, and the secretion-defective cell line in the absence of the conditions cited. Also included are modulating the secretion in a cell comprising an assassment of a biological activity of Zis-SR and an assay to identify a modulator of regulated secretion in a cell comprising an in assessment of a biological activity of Zis-SR its part or derivative is measurably different in the presence of the candidate compound as compared in its absence. The nucleic acid molecules or properties of a cell, for restoring or increasing the secretory compound as compared in its absence. The nucleic acid molecules or properties of a cell, for restoring or increasing the secretory clong term therapies to treat diseases or conditions associated with a long term therapies to treat diseases or conditions associated with a certain certain centain cells as an also be used to locate gene regions associated with a defect in the regulated secretory pathways in cells. The nucleic acid defect in the regulated secretory pathways in cells. The nucleic acid defect in the regulated secretory pathways in cells. The nucleic acid defect in the regulated secretory pathways in cells. The nucleic acid defect in the regulated secretory pathways in cells. The nucleic acid defect in the regulated secretory pathways in cells. The nucleic acid defect in the regulated secretory pathways and the secreto present sequence encodes mouse Zis-SR (zinc finger splicing Ser-Arg domain) diseases. The with extended

542 G; 782 T; 0 U; 0 Other; Sequence 2616 BP; 834 A; 458 C;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABR2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

This invention describes a newest neutron acre representing a symmetric cesistant yeast or fungi, identifying, or obtaining and identifying Baxresistant yeast or fungi, identifying, or obtaining and identifying a candida spp. sequences that are differentially expressed in a pathway eventually leading to programmed cell death or identifying inhibitors or inhibitor sequences of Bax-induced cell death. The products of the inhibitor sequences of Bax-induced cell death. The products of the invention have cytostatic, fungicide; immunosuppressive, virucide and vascincion have cytostatic, fungicide; immunosuppressive, virucide and vascincian and compositions, antisense molecules and antibodies are useful as medicaments or in preparing a medicament for treating, preventing and/or alterviating diseases associated with yeast or fungi or proliferative disorders, such as cancer, or for preventing apoptosis in certain diseases. The compounds or publicating a medicament for modifying the endogenic flora of humans and other mammals. The vaccine is useful for immunishing against yeast or inference in the composition of the mammals. The vaccine is useful for immunishing against yeast or inference in the section of disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ischaemia, diseases related with viral infections or neurodegenerations. This sequence represents a polynucleotide associated with the Bax gene described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                            describes a novel nucleic acid representing a synthetic
                   Claim 36; Fig 2; 344pp; English.

comprising providing a NA sequence (NA1) which encodes a polypeptide (PI), providing a NA sequence (NA1) which encodes a polypeptide (PI), providing codon altered NA sequences, each encoding P1 or a modified form of it, and recombining the codon altered NA sequences to produce a target codon altered NA which encodes a second protein. The method of the invention can be used for recombining codon-altered libraries of mucleic acids to produce new proteins, which have improvements in a desirable characteristic. Target nucleic acids include those coding for therapeutic proteins such as erythropoietin (BPO), insulin, peptide hormones, growth factors, cytokines, interferons, interleukina, leukaemia inhibitory factor, and oncostatin M, as well as transcription and expression activators and proteins from infectious coganisms for use as vaccines. The method can also be used to produce attenuated viruses which have reduced rates of reversion to wild type.

The present sequence represents an HIV codon altered env nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             432

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, plasmodium falciparum. Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II). (I) and polyclonal antisors or a monoclonal antisody raised to infection. (I) and polyclonal antisors or a monoclonal antisody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they can reduce or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the condum chromosome 2 and the subsequent identification of proteins can process hampered by the complexity of the parasitic lifecycle, and process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistence to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA7078 to AAA70287 and AAB1814 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a purified hypohidrotic ectodermal dysplasias protein (I) that promotes the development of hair follicles. (I) is a promoter of hair follicle growth and tooth growth. (I) is useful for the development of hair follicles. (I) is also useful for commercial and clinical diagnostic testing for ectodermal dysplasia (ED). (I) is also useful as a stimulant for hair and tooth growth, for stimulating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention isusful in developmental biology and in elucidaring cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ProThrSerGluThrThrAlaGluGlyGluGlyGluThrAspSer------

The invention relates to a method of increasing or decreasing one or more of hair follicle development, tooth development, or sweat gland development, in a tissue, involves altering ectodermal dysplasia (EDA1) isoform II (EDA1-II) activity in the tissue. The method is useful for increasing or decreasing hair follicle development, tooth development or sweat gland development, in a tissue of a patient suffering from an ectodermal disease such as X-linked hypohidrotic ectodermal dysplasia (KLHED), autosomal recessive hypohidrotic ectodermal dysplasia (HED) or alopecia. The method is useful for decreasing hair follicle development in a subject suffering from hirsuitism. The method is also useful for treating preast cancer and ectopic teeth, burns and trauma of skin due to

                                                                                                                                                                                                                             The present invention describes a purified hypohidrotic ectodermal dysplasias protein (1) that promotes the development of hair follicles. (1) is a promoter of hair follicle growth and tooch growth. (1) is useful for the development of hair follicles (1) is also useful for commercial and clinical diagnostic testing for ectodermal dysplasia (ED). (1) is also useful as a stimulant for hair and tooth growth, for stimulating endocrine sweat gland development in individuals from whom the normal sweating mechanism is compromised by disease or surgery, for stimulating the growth of mammary epithelial tissue, either for reconstructing or cosmetic purposes, and for promoting or maintaining differentiation of breast epithelium. (1) is also useful for functional analysis, antibody production and patient therapy. ABL51009 to ABL51122 and ABB0908 to

The invention relates to a method of increasing or decreasing one or more of hair follicle development, tooth development, or sweat gland development, in a tissue, involves altering ectodermal dysplasia (BDA1) isoform II [BDA1-II] activity in the tissue. The method is useful for increasing or decreasing hair follicle development, tooth development or sweat gland development, in a tissue of a patient suffering from an ectodermal disease such as X-linked hypohidrotic ectodermal dysplasia (HBD) or allopedia. The method is useful for decreasing hair follicle development in a subject suffering from hirsutism. The method is also useful for treating breast cancer and ectopic teeth, burns and trauma of skin due to surgery. The present sequence represents CDNA encoding human BDA1-II
                                                                                                                                                                                                                                                                    9

US-09-342-681C-14
; Sequence 14, Application US/09342681C
; Patent No. 6355782
; GENERAL INFORMATION:
; APPLICANT: Zonana et al.
; TITLE OF INVENTION: Hypohydrotic ectodermal dysplasia genes and proteins
; TITLE OF INVENTION: Hypohydrotic ectodermal dysplasia genes and proteins
; TITLE OF INVENTION: Hypohydrotic ectodermal dysplasia genes and proteins
; CURRENT APPLICATION NUMBER: 05/09/342,681C
; CURRENT FILING DATE: 1999-06-29
; PRIOR APPLICATION NUMBER: 60/12/36
; PRIOR APPLICATION NUMBER: 60/112,366
; REACH FILING DATE: 1998-12-15
; SOFTWARE: PatentIn Ver. 2.1
; SEQ ID NO. 14
LENGTH: 1176

Based upon the presence of a XhoI site followed by a run of 14 or
more T residues at the beginning of the sequence, this clone was
polyadenylated. The resulting Poly-T sequence has been removed. hit

Based upon the presence of a XhoI site followed by a run of 14 or
more T residues at the beginning of the sequence, this clone was
polyadenylated. The resulting Poly-T sequence has been removed. hit

Library Submitted (108-SEP-2000) Genoscope - Centre National de Sequencage, 2 rue Gaston Cremieux, CP 5706, 91057 EVRY cedex, FRANCE. (E-mail: seqrefégenoscope.cns.fr - Web: 1057 EVRY cedex, FRANCE. (E-mail: seqrefégenoscope.cns.fr - Web: a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces exiguus, Saccharomyces servazzil; Zygosaccharomyces rouxii, Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta. Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                           Candida tropicalis

```
/doce="Cran. kidney + adrenal; Vector: pBluescript II
//note="Crgan: kidney + adrenal; Vector: pBluescript II
KS(+); Site_1: EcoRI; Site_2: Not1; This normalized
library was constructed from 1 million independent clones.
CDNA synthesis was initiated using an oligo(dT) primer,
using methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA
was blunted, ligated to Not1 adapters, digested with
EcoRI; size-selected, and cloned into the Not1 and EcoRI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9212 and Bonaldo et al., Genome Research 6
(1996): 791, except that a significantly longer
reannealing hybridization was used."

Bulk tissue was collected from a whole 10 month old male
from the F6 strain. 1st strand cDNA was primed with a Not
I - oligo(dT) primer, double-stranded cDNA was cloned into
the Not I and EcoRV sites of pExpress-1. Library was
size-selected for >1.5 kb fragments for an average insert
size of 1.92 kb. Library was normalized to Cot5 with a
180-fold reduction of actin. A non-normalized version of
this library is also available (NICHD XGC_Swbl). Library
was constructed by Open Biosystems (Huntsville, AL)."
